

GLOSSARY OF MEDICAL DISEASES

The section contains a complete listing of all of the official medical terms for every known disease - both biological and psychological. This Medical Vocabulary is taken exactly and completely from the inventory of Medical Subject Headings (MeSH) which is created and maintained by the National Library of Medicine (NLM) and which constitutes the official nomenclature for all diseases as of the date of this publication.

This is a highly controlled vocabulary and is maintained under the supervision of Stuart Nelson, M.D., Head, Medical Subject Headings. To our knowledge, apart from the official documents of the NLM, no such comprehensive list of disease names has been published in any other book. It must be emphasized that this listing is for diseases only. It does not include the official terms for diagnostic techniques, therapies, chemical names, and other categories of bio-medical subjects. To use this vocabulary, find the official disease term about which you are interested and use that when searching bio-medical databases and/or Internet sites. If you are a patient or facilitator and uncertain about which term(s) apply, then show this listing to your doctor and ask for clarification. In your search query, enter the term exactly as designated here. For most of these medical problems, there are popular terms; and you may want to associate the official term with the popular term by using the Boolean operator “**OR**”. For example, “hypertension” is the official name for “high blood pressure” and one could structure a search with the following command: “**hypertension**” **OR** “**high blood pressure**”.
